

# Vattenfall Capital Markets Day 2007

Presentation by

Arne Mogren  
Head of Climate Policy at Vattenfall

Stockholm, 24 September 2007

# Currently we are diverging

## CO2 Emissions from fuel combustion Early peak vs BAU

# Global warming – millions at risk in 2080s

The EU has decided on 2°C as the maximum prudent global warming level

Source: Parry (2001)

# The 2°C warming target - risks at different CO2e concentration levels

Source: Meinshausen (2004); European Environment Agency

# Vattenfall's Global Climate Impact Abatement Map

**Abatement cost = additional cost of a low emission technology/ opportunity compared to business-as-usual (operational cost + depreciation)**

- 6 sectors: power, industry, transportation, buildings, forestry, agriculture
- 6 regions: North America, Western Europe, Eastern Europe incl. Russia, other industrialized countries, China, Rest of World
- 3 time frames: 2010, 2020, 2030

**The report shows realistic abatement *potentials*, not *forecasts*!**

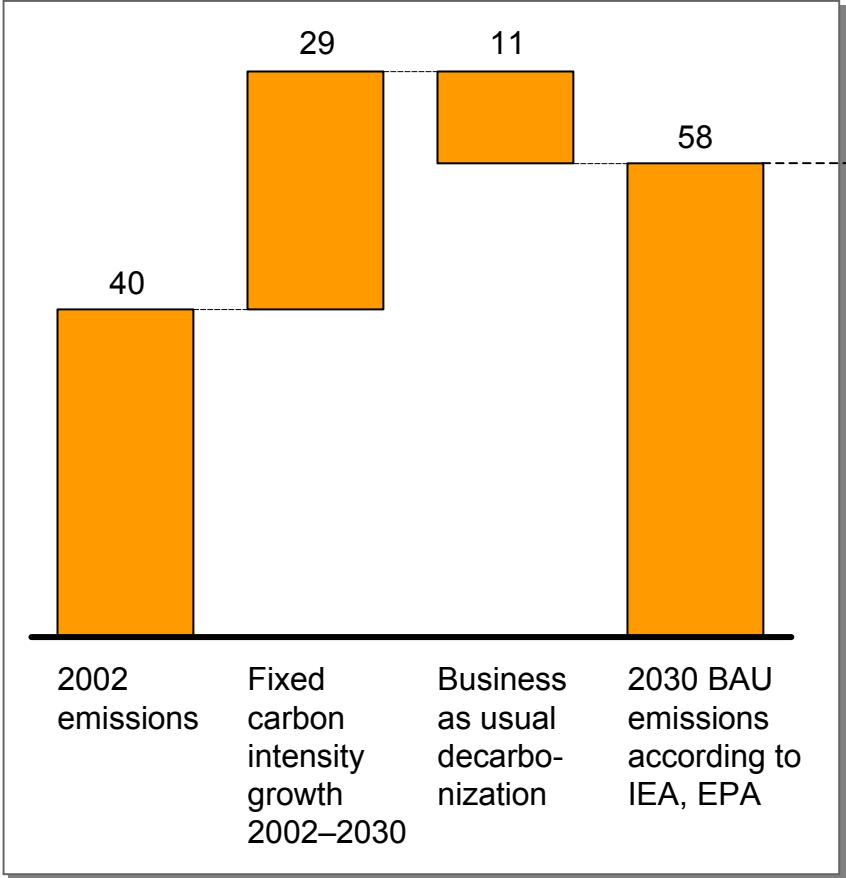

# What's needed by 2030 to contain global warming below 2°C?

CO<sub>2</sub>e emissions per year, Gton

Abatement required by 2030 compared to the BAU

Emissions growth through 2030 in the business as usual forecast

# Examples of negative cost abatement opportunities

## Opportunity

## Barriers

### Improved insulation

- 25% less energy for heating versus BAU
- 60% lower lifecycle heating cost\*
- Average abatement cost: -130 EUR/t CO<sub>2</sub>e
- Total abatement opportunity: 1.6 GtCO<sub>2</sub>e

### Misaligned incentives:

- Builders minimize upfront building costs – not life-cycle cost
- Buyers typically not involved in specifying insulation levels

### Compact Fluorescent Lamp

- 80% reduced energy consumption
- 41% lower lifecycle cost for consumer
- Average abatement cost: -90 EUR/t CO<sub>2</sub>e
- Total abatement opportunity: 0.2 GtCO<sub>2</sub>e

### End-user behavior:

- Lacking awareness of opportunities
- Savings low compared to total household budget
- Require very short payback times

\* Example for typical house in mild region with electrical heating

# Examples of abatement cost calculations – power sector

## Wind power

### Opportunity

- Average abatement cost:
  - 21 EUR / tCO<sub>2</sub>e
  - Of which 5 EUR / tCO<sub>2</sub>e is cost induced by the high penetration
- Total abatement opportunity: 0.5 GtCO<sub>2</sub>e

### Barriers

#### Environmental impact:

- Wind mill sites are often perceived as obstacles
- At higher penetration rates, intermittency becomes a costly issue

## Carbon capture & storage

- Potentially installed on 55% of all coal plants by 2030
- Abatement cost: 20 – 30 EUR/tCO<sub>2</sub>e in 2030
- Total abatement opportunity: 3.1 GtCO<sub>2</sub>e

### Storage:

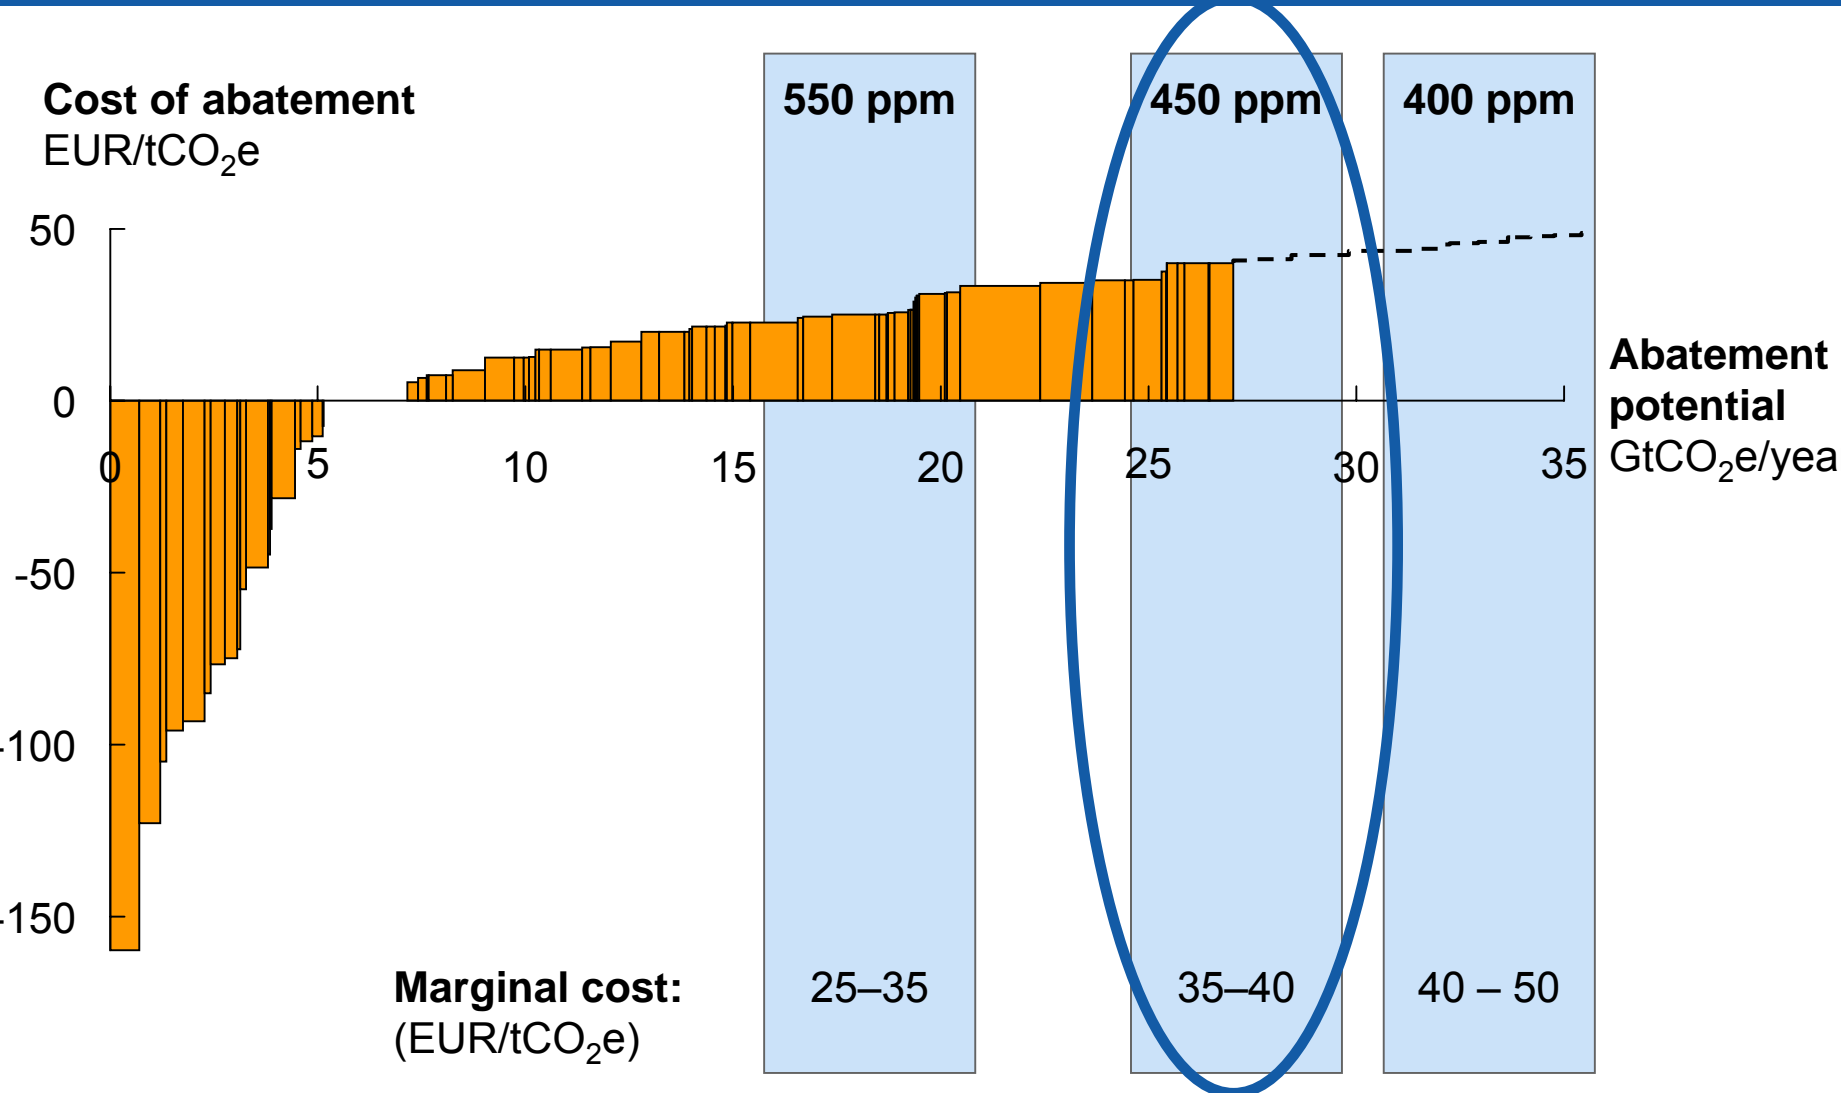

- Storage alternatives still need to be tested and approved

### Technological development:

- Technology currently existing but needs to be proven at scale in integrated solutions

# Marginal abatement cost in the different demand scenarios 2030

# Global cost curve of GHG abatement opportunities beyond business as usual

2030

- ~27 Gton CO<sub>2</sub>e below 40 EUR/ton (-46% vs. BAU)
- ~7 Gton of negative and zero cost opportunities
- Fragmentation of opportunities

# All sectors and regions will have to contribute to emissions reductions – global cooperation is key to the low carbon economy

GtCO<sub>2</sub>e, 2030

| Sectors        | Regions     |             |                               |                   |            |                 | Total       |
|----------------|-------------|-------------|-------------------------------|-------------------|------------|-----------------|-------------|
|                | US + Canada | OECD Europe | Eastern Europe (incl. Russia) | Other Industrial* | China      | Rest of world** |             |
| Power          | 1.3         | 0.8         | 0.3                           | 0.7               | 1.7        | 1.0             | 5.9         |

| 0–20                                      | 1.2            | 0.5            | 0.5                  | 0.3                                 | 1.2        | 3.4                | 7.1         |
| 20–40                                     | 1.6            | 0.9            | 1.1                  | 0.6                                 | 2.4        | 5.9                | 12.5        |
| <b>Total</b>                              | <b>4.3</b>     | <b>2.5</b>     | <b>2.6</b>           | <b>1.6</b>                          | <b>4.6</b> | <b>11.1</b>        | <b>26.7</b> |

- ~50% of negative cost opportunities are in industrialized world (buildings, transportation)
- ~40 % of 20–40 EUR/ton opportunities are in Rest of the World, largely driven by forestry opportunities

\* Australia, New Zealand, Japan, Singapore, South Korea, Taiwan, UAE, Saudi Arabia, Qatar, Oman, Kuwait, Israel, Bahrain, Mexico  
 \*\* Africa, South and Central America excl. Mexico, Asia excl. China and countries included in “Other industrialized” (see previous note)

# Estimates of total global cost for society

**Estimates of total abatement cost for the global society\***  
 % of global GDP 2030

**Comparables**  
 % of global GDP 2005

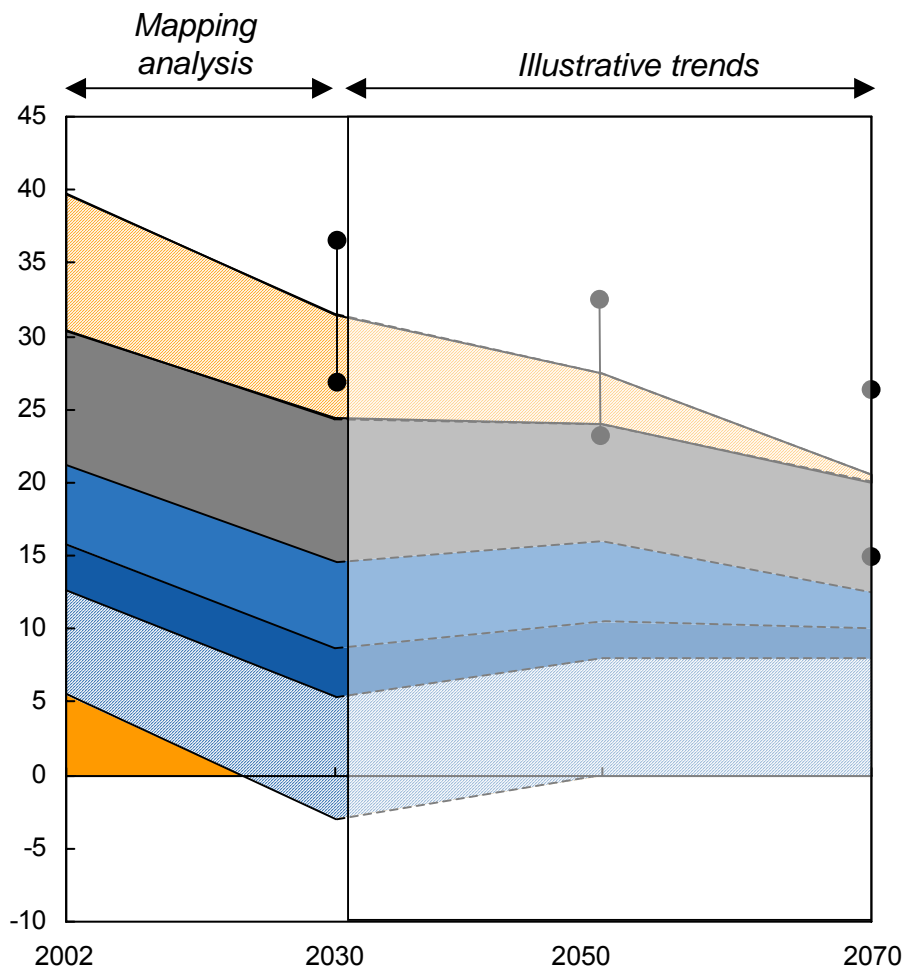

\* Lower boundary: Opportunities addressed in order of increasing cost and negative costs are set to zero; upper boundary: Average cost EUR 40/ton

\*\* Official Development Assistance from OECD countries; does not include humanitarian aid or private donations

# Possible long-term development of emissions per sector – illustrative trends

GtCO<sub>2</sub>e per year

● Emissions to maintain 450 ppm CO<sub>2</sub>, Gt CO<sub>2</sub>e

## Potential long term trends

-  **Power: Zero;** long term if all fossil fuel plants are equipped with CCS
-  **Industry: stable;** reduction at large emitters (e.g., via CCS) balanced by new, small emitters
-  **Transport: stable/decreasing;** more bio fuels, hybrids and plug-ins balance increased transportation need
-  **Buildings: stable;** efficiency improvements balance population growth, further reduction through electrification
-  **Agriculture/Waste: stable;** improvements in carbon efficiency balance population increase
-  **Forestry: zero;** deforestation and forestation reaches equilibrium

# Three different types of sectors

## 2030 abatement potential

GtCO<sub>2</sub>e    EUR/tCO<sub>2</sub>e    **Key characteristics**

**Power and industry**

11.9

15–40

- Mainly industrialized countries
- Small number of large, rational emitters
- High cost
- Minor consumer implications
- Competitive distortion issues

**Transportation and buildings**

6.6

<5 (often negative)

- Mainly industrialized countries
- Billions of small emitters
- Low/negative cost
- High consumer implications

**Forestry , agriculture, waste**

8.2

10–40

- 60+% developing countries
- Billions of small emitters
- Medium/high cost
- Big social implications
- Hard to measure & monitor

**TOTAL**

**26.7**

# Key regulatory mechanisms identified in the abatement investigation

**A** Policies/ standards for buildings and transportation, or a certificate system

**B** Long-term stable international system for power and industry

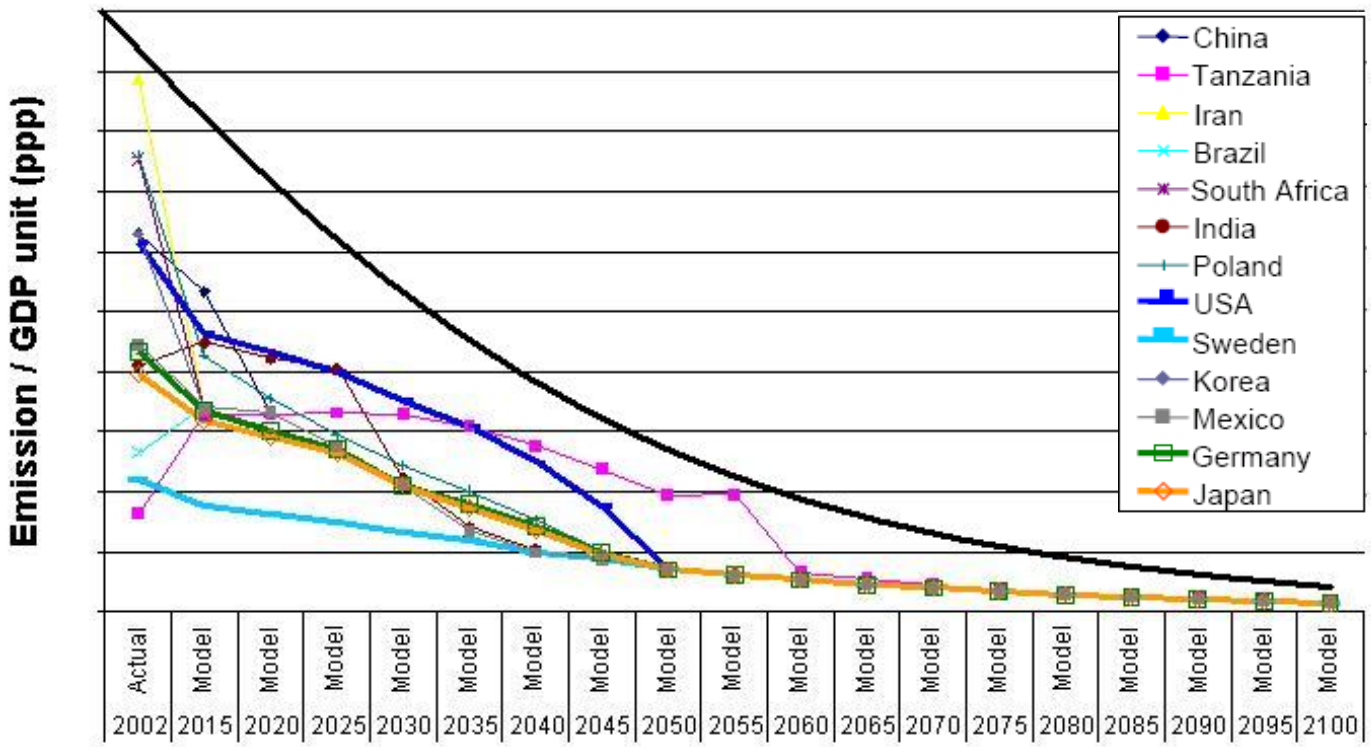

**D** International system for agriculture and deforestation, linked to the overall developing world agenda

**C** Mechanism to drive selected key technologies down the learning curve

# The core of any solution is convergence – market demand can be created

## The fish trap model – a funnel – shaped convergence process

# Supply and demand lead to market incentives

## Vattenfall's Global climate abatement map

Click on sectors and regions to navigate

The map features several sectors and regions, each with an icon and a label: Industry (factory), Buildings (skyscrapers), Power (nuclear reactor), Transport (airplane), Transition economies (cathedral), North America (Statue of Liberty), Other industrials (ship), Forestry (trees), Agriculture & waste (farm), Rest of the world (pyramids), Europe OECD (clock tower), and China (Great Wall).

### Global overview

In 2002 global emissions of greenhouse gases were about 40 Gt CO<sub>2</sub>e. The emissions are projected to grow to 58 Gt CO<sub>2</sub>e 2030. To get on track for long-term climate stabilization, emissions in 2030 should not exceed 31 Gt CO<sub>2</sub>e.

A total reduction potential of around 27 Gt CO<sub>2</sub>e below a cost of €40/tonne CO<sub>2</sub>e has been identified. The average reduction cost in 2030 is estimated to be around €15/tonne CO<sub>2</sub>e.

| Metric                | Value                       |
|-----------------------|-----------------------------|
| Reduction requirement | 27 Gt CO <sub>2</sub> e     |
| Reduction potential   | 27 Gt CO <sub>2</sub> e     |
| Average cost          | €15/tonne CO <sub>2</sub> e |
